## How are the Mental Health Measures Calculated?

“Chronic Sadness” is measured by the percentage of students who report feeling so sad or hopeless almost every day for two weeks or more that they stopped doing some usual activities during the past 12 months. “Considered Suicide” – a measure of suicide ideation – is assessed by the percentage of students who report that they seriously considered attempting suicide in the past year.

The three indicators, “Social and Emotional Distress,” “Life Satisfaction,” and “Optimism,” are based on multiple items. The scores are calculated by averaging the percentage of students who report the top-two response categories on the survey items that comprise each scale. “Social and Emotional Distress” and “Optimism” are computed by averaging the percentage of respondents who report “Pretty much true” or “Very much true” on the survey items that comprise the scale. “Life Satisfaction” is calculated by averaging the percentage of respondents who report “Satisfied” or “Very satisfied” on the survey items that comprise the scale. Students’ satisfaction with their life experiences is a widely used wellness indicator. High life satisfaction is related to other positive resilience experiences (e.g., high level of school belonging) and fewer mental health challenges.

A value of 60 on the “Life Satisfaction” indicator, for example, means that on average, students report “Satisfied” or “Very satisfied” on three of the five “Life Satisfaction” survey items.

To construct the “California Student Wellness Index,” the 10 items that comprise both the social emotional distress and life satisfaction scales were each recoded such that the lowest possible score on each item was zero. These scores were then added together, resulting in a total raw score that could vary between 0 and 40. To calculate the scale score for the Student Wellness Index, the raw score was divided by the maximum possible score (40). Additionally, for clearer comparisons across groups and for interpreting future trends across time, a standardized version of the Student Wellness Index was constructed based on statewide data from the 2021–23 Biennial State CHKS. The standardized score (presented in the table) is scaled to have a mean score of 100 and a standard deviation of 15.

All of the survey items that comprise the scales/measures are listed below.

(1) Chronic Sadness (1 item)

- o During the past 12 months, did you ever feel so sad or hopeless almost every day for two weeks or more that you stopped doing some usual activities?

(2) Considered suicide (1 item)

- o During the past 12 months, did you ever seriously consider attempting suicide?

(3) Social and Emotional Distress<sup>1</sup> (5 items)

*Over the past 30 days, how true do you feel these statements are about you?*

- o I had a hard time relaxing.
- o I felt sad and down.
- o I was easily irritated.
- o It was hard for me to cope and I thought I would panic.
- o It was hard for me to get excited about anything.

(4) Life Satisfaction<sup>2</sup> (5 items)

*I would describe my satisfaction with...*

- o my family life as...
- o my friendships as...
- o my school experience as...
- o myself as...
- o where I live as...

(5) Optimism<sup>3</sup> (3 items)

- o Each day I look forward to having a lot of fun.
- o I usually expect to have a good day.
- o Overall, I expect more good things to happen to me than bad things.

(6) California Student Wellness Index<sup>4</sup> (10 items)

Results are based on responses from students in grades 7, 9, or 11, or respondents attending non-traditional (Non-Trad.) schools on the California Healthy Kids Survey. Non-traditional schools include Adult Education Centers, Continuation High Schools, County Community, District Community Day Schools, Juvenile Court Schools, Opportunity Schools, and Special Education Schools.

Results are not included if less than 50% of students or less than 15 respondents per grade provided data at the school or district.
